B. Academic History

6. a. Research Activities

My primary interests are the study of high-energy hadron collisions produced at the very highest energies possible. My research focuses on the ATLAS experiment at the CERN Large Hadron Collider (LHC) in Geneva, Switzerland, where we are studying 7 and 8 TeV proton-proton collisions. I am also completing studies of 2 TeV proton-antiproton collisions at the Collider Detector at Fermilab (CDF), a facility designed, constructed and operated by a collaboration of physicists from 40 institutions. I am particularly interested in studies of the top quark, the last of the expected fundamental building blocks predicted by the current “Standard Model” of high energy physics to be discovered. Having published conclusive evidence of its existence in 1995, I am still involved in top quark studies using data collected by the ATLAS experiment. My students and I have specialized in developing techniques for making innovative measurements of top quark properties. I am also involved in the development of advanced statistical techniques applied to the analysis of particle physics data.

I have held various leadership and management roles. I was head of the Canadian CDF group from its inception in 1990 to 1999 and was one of the two coordinators of the CDF Heavy Flavour group for over two years between 1990 and 1992. This internal group was the focus of all of the collaborations research in heavy quark physics (top quark searches and bottom quark studies). I also was the head of the CDF Offline Group from 1993 to 1995. During that time, I was responsible for all software development, data processing and central computing facilities within the collaboration. I have served as member or chair of approximately 35 internal review committees in CDF over the last 25 years.

My secondary research activity is the development of advanced detectors and computational systems for the CDF and ATLAS experiments. My group designed parts of the data collection systems for the SDC detector, a device that was intended to search for the Higgs boson at the Superconducting Super Collider (SSC). I am now collaborating on the development of a Grid

computing model for the ATLAS experiment that is proposed to perform a similar search at the Large Hadron Collider (LHC). My group designed a system of electronics that would allow the CDF detector to detect and measure charged particles in the Level 1 trigger system.

My research interests prior to 1986 focused on the study of strange mesons, which formed the topic of my Ph.D. dissertation. I studied the orbitally and radially excited states of the K^* meson, as this system provided us with the cleanest experimental view of the spectroscopy of a light quark-antiquark state.

During the period 1978 through 1980, I participated in the first measurements of the lifetimes of charmed hadrons as a member of a University of Toronto research group.

6. b. Research Awards

I currently hold the following research awards:

- An NSERC Project Grant supporting the Canadian effort on the ATLAS experiment. The University of Toronto portion of this \$5.760M award in 2014-15 is \$1,007,000. This is held jointly with Profs. P. Krieger, R. S. Orr (PI), P. Savard, R. Teuscher and W. Trischuk.
- A Canada Foundation for Innovation award of \$15M from the Innovation Fund for the SCINET high performance computing facility, matched by the a contribution of \$15M from the Ontario Research Foundation. I am a co-investigator with an interest in using this facility for Tier II computing for the ATLAS experiment.
- A grant from the Canadian Institute for Advanced Research of \$20,000 annually to support my research effort while Senior Vice-President, Research.

12. d. Course Development

I have been involved in the development of software for use in the undergraduate physics program at the University of Toronto. I developed a number of Mathematica applications that were used by PHY352S students during the 1992 spring term to both solve problems and improve their understanding of various concepts presented in lectures.

I also developed a set of lecture notes for PHY352S that are distributed to students prior to lectures. These notes are meant to provide the students with a complete presentation of the course material, and are approximately 150 pages in length.

I have developed a similar set of lecture notes for PHY252S. I have used Mathematica extensively for the illustrations and problems presented in the notes.
