LECTURE 9: Wave Packets

Goal of the lecture: describe the wave function of a quantum particle using wave packets

What I expect you to learn:

- what are waves packets
- what is the group and phase velocities of wave packets
- what are Fourier Transforms
- how to express the wave function in momentum space
- how to calculate Fourier Transforms

(This roughly corresponds to section 2.4, appendix A of textbook)

A quick recap

→ We related wave-type quantities to a particle's energy and momentum: $p = k\hbar$, $E = \hbar\omega$

→ For a free particle we have: $E = \frac{p^2}{2m} = \frac{mv^2}{2}$

which means we the following relation between ω and k:

$$\boxed{\omega = \frac{\hbar k^2}{2m}}$$

→ we found an equation that obeyed this relation:

$$\boxed{-\frac{\hbar^2}{2m}\frac{\partial^2\psi}{\partial x^2} + V\psi = i\hbar\frac{\partial\psi}{\partial t}}$$

A simple solution to this equation is

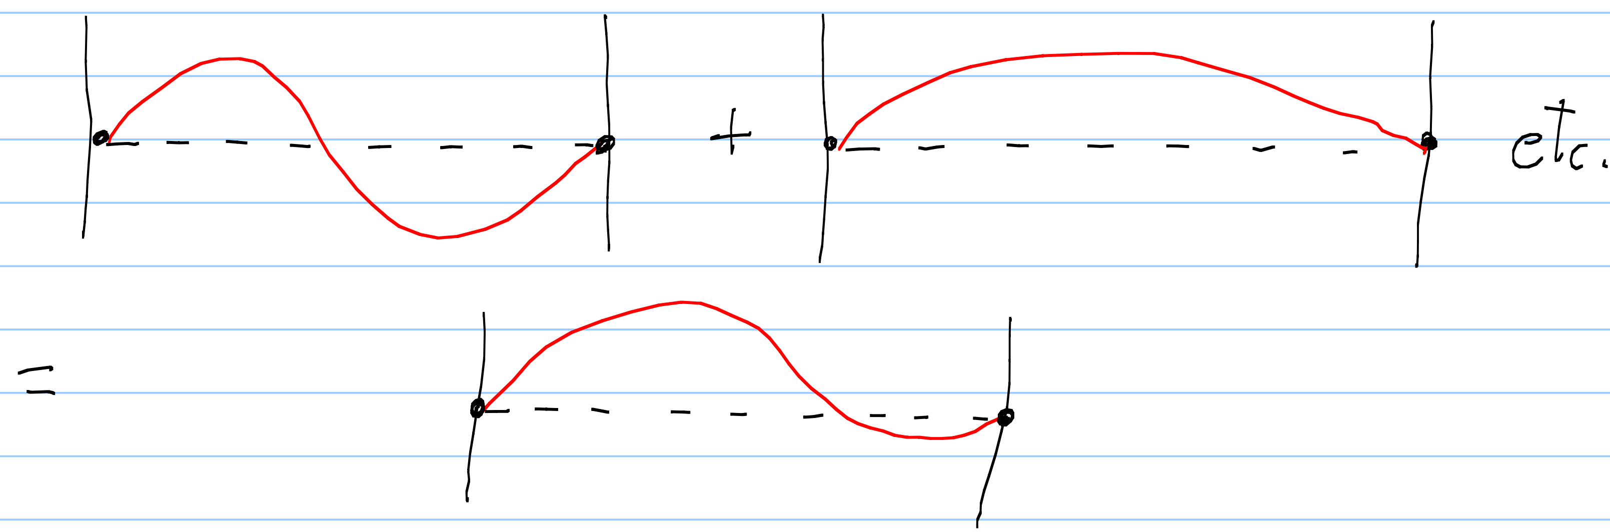
$$\psi(x,t) = A\, e^{i(kx-\omega t)}$$

A quick recap (cont.) ③

- we saw that in order to account for interference effects, we must be able to superimpose wave functions e.g.

$$\psi = c_1 \psi_1 + c_2 \psi_2 + \ldots$$ (superposition principle)

- As a first step on our way to superimposing wave functions, we considered the superposition of sine waves in the case of a string attached at two ends:



A QUICK RECAP (CONT.)

- WE SAW THAT WE COULD EXPRESS AN ARBITRARY WAVE FORM ON THE STRING AS A SUM OF SINE AND COSINE WAVES i.E A FOURIER SERIES:

$$① \quad f(x) = \frac{A_0}{2} + \sum_{n=1}^{\infty} A_n \sin nx + \sum_{n=1}^{\infty} B_n \cos nx$$

FOR EXAMPLE WE SAW:

we found the amplitudes for this example

note that ① has discret values of K

We need to work with a continuum of K values

Wave Functions for Fixed p

For a fixed momentum, we have

$$\Psi(x,t) = A\, e^{i(kx-\omega t)}$$
$$= A\, e^{i/\hbar\,(px-Et)}$$

Note that

$$\boxed{-i\hbar\frac{\partial}{\partial x}}\Psi = p\Psi\,, \qquad \boxed{i\hbar\frac{\partial}{\partial t}}\Psi = E\Psi$$

differential operators

Probability interpretation of $|\Psi|^2 \Rightarrow$

$$\int_{-\infty}^{\infty} |\Psi(x,t)|^2\, dx = 1$$

The plane wave cannot be normalized to unity

WAVE PACKETS IN 1 DIMENSION

WE NEED TO SUM PLANE WAVES ... THE MOST GENERAL EXPRESSION IS:

$$\Psi(x,t) = \frac{1}{\sqrt{2\pi\hbar}} \int_{-\infty}^{\infty} \varphi(p)\, e^{i/\hbar (px - Et)}\, dp$$

↳ Amplitude for wave of momentum p (or $\hbar k$) → can be complex

Assume that $\varphi(p)$ is peaked about $p = p_0$
i.e. falls to 0 outside $[p_0 - \Delta p,\ p_0 + \Delta p]$

Take $\beta(p) = px - ET$

$|\Psi(x,t)|$ will be largest when $\beta(p)$ is almost constant around $p = p_0$

→ remember $e^{i\theta} = \cos\theta + i\sin\theta$

$\Rightarrow$ get max of $|\Psi_{,x,t}|$ when $\frac{d\beta}{dp} \simeq 0$

WAVE PACKETS (CONT.)

→ The max of $|\Psi(x,t)|$ will correspond to the center of the wave packet

We have $E = \frac{p^2}{2m}$, $B = px - Et$

$$\frac{dB}{dp} = x - \frac{p}{m}t = x - vt = 0$$

$$x = vt$$

$\hookrightarrow v_g$

v_g : velocity of the group of plane waves

$v_g = \frac{d\omega}{dk} = \frac{dE}{dp}$, v_p = velocity of plane waves

$$A e^{i(kx - \omega t)} = A e^{ik(x - \frac{\omega}{k}t)} \Rightarrow v_p = \frac{\omega}{k}$$

Let's take a look here:

http://webphysics.davidson.edu/Applets/superposition/GroupVelocity.ht

WAVE PACKETS (CONT.)

WE CAN EXPAND $E(p)$ ABOUT p_0 → TAYLOR EXPANSION

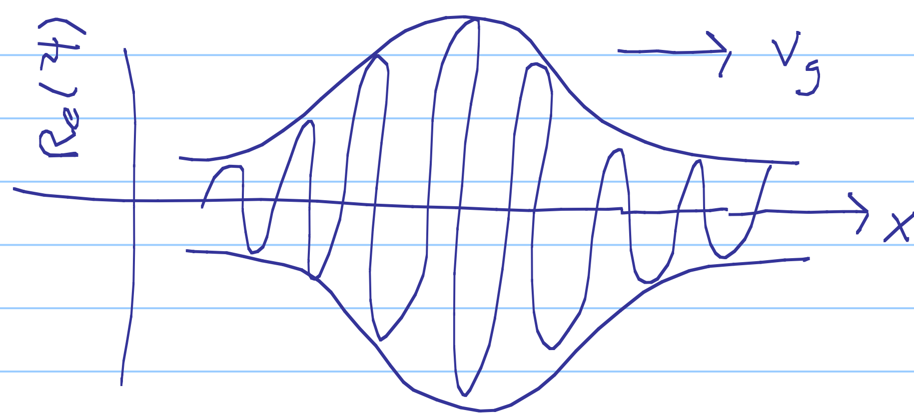
$$E(p) = p^2/2m$$

$$E(p) = E(p_0) + (p-p_0)\left.\frac{dE(p)}{dp}\right|_{p=p_0} + \frac{1}{2}(p-p_0)^2 \left.\frac{d^2E(p)}{dp^2}\right|_{p=p_0} + \dots$$

$$= \frac{p_0^2}{2m} + (p-p_0)\frac{p_0}{m} + \frac{(p-p_0)^2}{2m} + \dots$$

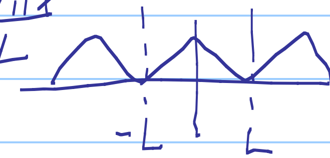
↳ neglect : $\Delta p^2 t \ll 1$

$$\psi(x,t) = \underbrace{e^{i/\hbar(p_0x - E(p_0)t)}}_{\text{plane wave}} \cdot \underbrace{\frac{1}{\sqrt{2\pi\hbar}}\int_{-\infty}^{\infty} e^{i(px - p_0)(x - v_g t)/\hbar}\,\phi(p)\,dp}_{\text{envelope function}}$$



FOURIER TRANSFORM INTERLUDE

$$F(x) = \frac{1}{2} A_0 + \sum_{n=1}^{\infty} A_n \sin\frac{n\pi x}{L} + B_n \cos\frac{n\pi x}{L}$$



we can also write:

$$F(x) = \frac{1}{\sqrt{2\pi}} \sum_{n=-\infty}^{\infty} C_n e^{in\pi x/L}$$

For non-periodic functions we take $L \to \infty$

as $L \to \infty$, differences between terms in the series become smaller:

$$F(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} C_n e^{in\pi x/L} \, dn$$

let $k = n\pi/L$ and $g(k) = \frac{L C_n}{\pi}$, $dk = dn \cdot \frac{\pi}{L}$

$$F(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} g(k) e^{ikx} \, dk, \quad g(k) = \frac{1}{\sqrt{2\pi}} \int F(x) e^{-ikx} \, dx$$

Fourier Transforms (cont.)

Physically what does this all mean?

For $T = 0$, we have

* $$\psi(x) = \frac{1}{\sqrt{2\pi\hbar}} \int_{-\infty}^{\infty} \varphi(p)\, e^{ipx/\hbar}\, dp$$

→ probability amplitude for finding particle at x

→ sum of plane waves with amplitude $\varphi(p)$

* $$\varphi(p) = \frac{1}{\sqrt{2\pi\hbar}} \int_{-\infty}^{\infty} \psi(x)\, e^{-ipx}\, dx$$

→ probability amplitude for finding particle with momentum p

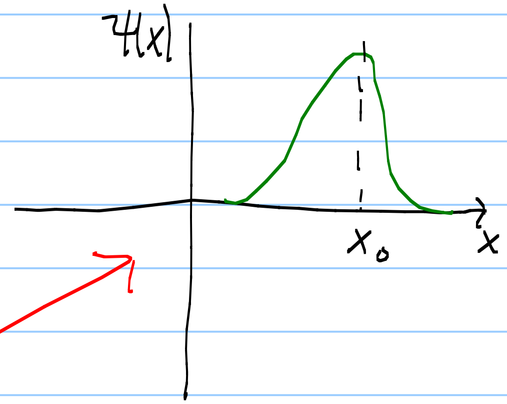
→ sum of plane waves with amplitude $\psi(x)$

→ momentum space wave function

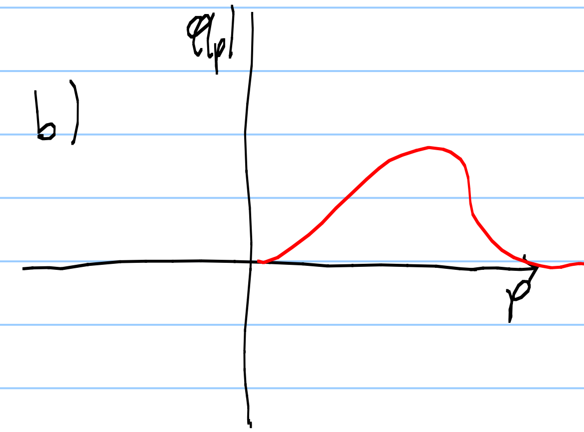
Fourier Transforms (cont.)

at $T=0$

a)



b)



For a particle whose prob. amplitude dist. looks like this, what are the amplitudes of its component plane waves?

At $T=0$, the particle is most probably at x_0 and it's velocity is given by the group velocity:

$$v_g = \left.\frac{dE}{dp}\right|_{x=x_0}$$
