

Different Realizations of Ionization Trackers

MWPC

Drift Chamber

Jet Chamber

Time Projection Chamber

Drift Chamber Cell

Fig. 11. Cell structure of large area drift chamber [MA 77].

- Carefully shape potential (field lines)
- Optimize drift time – space relation

Fig. 12. Linear relation between drift time and position [MA 77].

Left-Right Ambiguity Resolution

2 anode wires

staggered anode wires

ghost track

inclined anode plane

good for high magnetic field

Jet Chamber

e^+e^- annihilation at 30 GeV

Lorentz Angle – Drift Chamber in Magnetic Field

- Drifting electron will see

Electric Field $\bar{E}$

Magnetic Field $\bar{B}$

$$m\dot{\bar{v}} = q(\bar{E} + \bar{v} \times \bar{B})$$

- Will also see stochastic force due to collisions with gas molecules

$$m\dot{\bar{v}} = q(\bar{E} + \bar{v} \times \bar{B}) + mA(t)$$

- Assume over time

$\bar{E}, \bar{B}$ = stochastic retardation
acceleration

constant v_D

$$\dot{\bar{v}}_D = 0 = \frac{q\bar{E}}{m} + \left(\bar{v}_D \times \frac{q\bar{B}}{m} \right) - \langle A(t) \rangle$$

$$A(t) \rightarrow \frac{v_D}{\tau} \text{ mean time between collisions}$$

$$\frac{\bar{v}_D}{\tau} - \left(\bar{v}_D \times \frac{q\bar{B}}{m} \right) = \frac{q\bar{E}}{m}$$

solution:

$$\bar{v}_D = \frac{\mu}{1 + \omega^2 \tau^2} \left(\overset{(1)}{\bar{E}} + \overset{(3)}{\frac{\bar{E} \times \bar{B}}{B}} \omega \tau + \overset{(2)}{\frac{(\bar{E} \cdot \bar{B}) \bar{B}}{B^2}} \omega^2 \tau^2 \right)$$

$$\mu = \frac{q\tau}{m} \text{ electron mobility}$$

$$\omega = \frac{q\bar{B}}{m} \text{ cyclotron frequency}$$

Lorentz Angle – Drift Chamber in Magnetic Field

solution:

$$\bar{v}_D = \frac{\mu}{1 + \omega^2 \tau^2} \left(\overset{(1)}{\bar{E}} + \frac{\overset{(3)}{\bar{E}} \times \bar{B}}{B} \omega \tau + \frac{\overset{(2)}{(\bar{E} g \bar{B})} g \bar{B}}{B^2} \omega^2 \tau^2 \right)$$

- Drift velocity has three components

(1) parallel to $\bar{E}$

(2) parallel to $\bar{B}$

(3) perp to plane of $\bar{E}, \bar{B}$

- If $\bar{E}, \bar{B}$ perpendicular $\bar{E} = (E_x, 0, 0)$
 $\bar{B} = (0, 0, B_z)$

$$v_x = \mu E_x \frac{1}{1 + \omega^2 \tau^2}$$

$$v_y = -\mu E_x \frac{\omega \tau}{1 + \omega^2 \tau^2}$$

$$v_z = 0$$

$$\tan \alpha = \omega \tau = \frac{v_y}{v_x}$$

$$\tan \alpha = \omega \tau = \frac{q \bar{B}}{m} \frac{m \mu}{q} = \mu B = \frac{v_D}{E} B$$

LORENTZ ANGLE

DRIFT
PATH

$\vec{E} \times \vec{B}$ v_{DRIFT} DEVIATES FROM
ELECTRIC FIELD DIRECTION

$$\tan \alpha = \frac{v_D}{E} B$$

$$\tan \alpha = \frac{v_D}{E} B$$

Compensate for Lorentz angle by
tilting electric field in drift cells

Structure of ZEUS DC

- Total wire tension 12 tons
- 4608 *W* sense wires (30 micron)
- 19584 *CuBe* field wires
- 120 micron space resolution
- 2.5mm 2 track resolution
- 500 ns max drift time

Tilted E Field – R-L ambiguity resolution

Zeus CTD Event Display

22

Square Drift Cells - ARGUS

- Precision
- High Density of Information
- Pattern recognition complex ➡ R-L ambiguity resolved by trying all possible combinations

ARGUS Events

ARGUS

dE/dx Particle Identification

BaBar Drift Chamber

constructed at TRIUMF

Time Projection Chamber

- Only two drift cells
- $\vec{E}$ parallel to $\vec{B}$, so no Lorentz angle

- measure $z, \sqrt{z^2}$ from drift time $\sigma_{r,\phi} : 180\mu$

- measure r, Φ from pads and wires on endplates $\sigma_z : 200\mu$

- Good pattern recognition and precision $\rightarrow$ space charge limitation in medium multiplicity environment

DELPHI Time Projection Chamber

wire – drift time

pad – position on the wire

Diffusion in TPC

Why does diffusion not ruin resolution?

transverse diffusion

Diffusion limits spatial resolution

$$\sigma = \sqrt{\frac{2L}{3v_D}} u \lambda$$

drift length (points to $2L$)

mean electron velocity (points to v_D)

mean free path (points to λ)

Diffusion in TPC

Compare this to previous plot with $B=0$

$\vec{B} \neq 0$ reduces diffusion if $\vec{E} \times \vec{B} = 0$

particles drift along tight helices

transverse diffusion reduced by

$$\frac{1}{1 + \omega^2 \tau^2}; \omega = \frac{eB}{m}$$

SPACE CHARGE LIMITATIONS

HEAVY IONS PRODUCED BY GAS AMPLIFICATION

→ DISTORT ELECTRIC FIELD

USE GATED GRID → ONLY ALLOW ELECTRONS
INTO AMPLIFICATION
REGION FOR GOOD
TRIGGERS

ALICE

TPC $\rightarrow$ HIGH MULTIPLICITY
 GOOD PATTERN RECOGNITION

$\rightarrow$ LOW RATE

$\rightarrow$ GOOD dE/dx

PARTICLE
IDENTIFICATION

ATLAS Tracker

Inner Tracker

$$3.0 \times 10^{33} \text{ cm}^{-2} \text{ s}^{-1}$$

$$B_d^0 \rightarrow J/\psi K_s^0$$

$$H \rightarrow ZZ^* \rightarrow e^+e^-e^+e^- \quad (m_H = 130 \text{ GeV})$$

$$10^{34} \text{ cm}^{-2} \text{ s}^{-1}$$

ATLAS Straw Tracker

Straw tracker test beam module

Assembly of straw tracker

PARTICLE ID IN
ATLAS STRAW TRACKER

→ TRANSITION
RADIATION

Inner Detector (ID)

The Inner Detector (ID) comprises four sub-systems:

- Pixels ($0.8 \cdot 10^8$ channels)
- Silicon Tracker (SCT) ($6 \cdot 10^6$ channels)
- Transition Radiation Tracker (TRT) ($4 \cdot 10^5$ channels)
- Common ID items

◆ Microstrip gas chambers

(A. Oed, NIM A 263 (1988) 352)

geometry and typical dimensions
(former CMS standard)

Gold strips
+ Cr underlayer

Field geometry

Glass DESAG AF45 + S8900
semiconducting glass coating,
 $\rho=10^{16} \Omega/\square$

Fast ion evacuation → high rate capability
 $\approx 10^6 /(\text{mm}^2 \cdot \text{s})$

CHARGE BUILD UP ON MICROSTRIPS

THE SUBSTRATE ON MICROSTRIPS HAS A
HIGH RESISTANCE

IN VERY HIGH RATE ENVIRONMENT

→ CHARGE BUILD UP

→ DISCHARGE

→ DAMAGE
